Review

MATH 1910 Recitation §5.1 (Approximating and Computing Area); §5.2 (The definite integral) August 30, 2016

(1) Approximations to the area under the graph of f over the interval [a, b]:

Right-endpoint	Left-endpoint	Midpoint
$R_N = \Delta x \sum_{j=1}^{N} f(x_j)$	$L_N = \Delta x \sum_{j=0}^{N-1} f(x_j)$	$M_N = \Delta x \sum_{j=0}^{N-1} f\left(\frac{x_j + x_{j+1}}{2}\right) $ (5)

(2) If f is continuous on [a, b], then the area A under the graph y = f(x) is defined as

$$A := \left[\lim_{N \to \infty} R_N = \lim_{N \to \infty} L_N = \lim_{N \to \infty} M_n \right]^{(6)}$$

- $\left. igcap_{(7)}^{(7)}
 ight.$ of the region between the graph of f and (3) The **definite integral** is the signed area on [a, b], then f is integrable over [a, b]. the *x*-axis. If f is continuous
- (4) Some properties of definite integrals:

(a)
$$\int_{a}^{b} (f(x) + g(x)) dx = \int_{a}^{b} f(x) dx + \int_{a}^{b} g(x) dx$$

(b)
$$\int_a^b Cf(x)dx = \left[C \int_a^b f(x)dx \right]^{(10)}$$

(c)
$$\int_a^b f(x)dx = -\int_a^a f(x)dx$$

(d)
$$\int_a^b f(x)dx + \int_b^c f(x)dx = \left[\int_a^c f(x)dx \right]^{(11)}$$

(5) Some formulas for computing integrals

(a)
$$\int_a^b C dx = \boxed{C(b-a)}^{(12)}$$

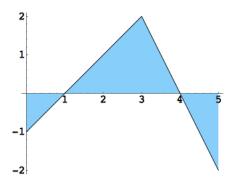

(b)
$$\int_{0}^{b} x dx = \frac{1}{2}b^{2}$$

(c)
$$\int_0^b x^2 dx = \left[\frac{1}{3} b^3 \right]^{(14)}$$

(6) **Comparison Theorem:** If $f(x) \le g(x)$ on [a,b], then $\int_a^b f(x) dx \le \int_a^b g(x) dx$.

§5.1 (Approximating and Computing Area); §5.2 (The definite integral)

(1) Use the graph of g(x) given below to evaluate the following integrals.

(a)
$$\int_0^3 g(x) \, dx$$

SOLUTION: The region bounded by the curve y = g(x) and the x-axis over the interval [0,3] is comprised of two right triangles, one with area $\frac{1}{2}$ below the axis, and one with area 2 above the axis. The definite integral is therefore equal to $2 - \frac{1}{2} = \frac{3}{2}$.

(b)
$$\int_{3}^{5} g(x) dx$$

SOLUTION: The region bounded by the curve y = g(x) and the x-axis over the interval [3,5] is comprised of another two right triangles, one with area 1 above the axis and one with area 1 below the axis. The definite integral is therefore equal to zero.

(c)
$$\int_0^5 g(x) \, dx$$

SOLUTION: This is the sum of the previous two integrals, by our integral properties.

$$\int_0^5 g(x) \, dx = \int_0^3 g(x) \, dx + \int_3^5 g(x) \, dx = \frac{3}{2} + 0 = \frac{3}{2}$$

(2) Find a formula for R_N for $f(x) = 3x^2 - x + 4$ over the interval [0,1].

SOLUTION: We have $\Delta x = \frac{1-0}{N} = \frac{1}{N}$. We will use the right endpoint, so $x_j = 0 + j\Delta x$. So using the formula for R_N , we have

$$R_{N} = \Delta x \sum_{j=1}^{N} f(x_{j}) = \Delta x \sum_{j=1}^{N} f(0 + j\Delta x)$$

$$= \frac{1}{N} \sum_{j=1}^{N} f\left(\frac{j}{N}\right)$$

$$= \frac{1}{N} \sum_{j=1}^{N} \left(3 \frac{j^{2}}{N^{2}} - \frac{j}{N} + 4\right)$$

$$= \frac{3}{N^{3}} \sum_{j=1}^{N} j^{2} - \frac{1}{N^{2}} \sum_{j=1}^{N} j + \frac{4}{N} \sum_{j=1}^{N} 1$$

$$= \frac{3}{N^{3}} \left(\frac{N^{3}}{3} + \frac{N^{2}}{2} + \frac{N}{6}\right) - \frac{1}{N^{2}} \left(\frac{N^{2}}{2} + \frac{N}{2}\right) + \frac{4}{N}N$$

$$= 1 + \frac{3}{2N} + \frac{1}{2N^{2}} - \frac{1}{2} - \frac{1}{2N} + 4$$

- (3) Calculate $\int_{2}^{5} (2x+1) dx$ in three ways:
 - (a) As a limit $\lim_{N\to\infty} R_N$.

SOLUTION:

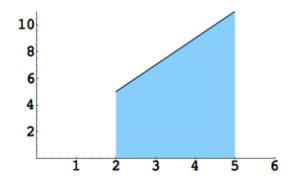

$$R_N = \sum_{k=1}^N \left(2\left(2 + \frac{3k}{N}\right) + 1\right) \frac{3}{N} = \sum_{k=1}^N \left(\frac{15}{N} + \frac{18k}{N^2}\right) = 15 + \frac{18}{N^2} \frac{N(N+1)}{2} = 15 + 18\left(\frac{1}{2} + \frac{1}{2N}\right)$$

Then taking the limit as $N \to \infty$, we see that

$$\lim_{N\to\infty}R_N=\lim_{N\to\infty}\left(15+9+\frac{1}{2N}\right)=24.$$

(b) Using geometry, interpreting this as the area under a graph.

SOLUTION: This is the area of the trapezoid pictured below.

Which is
$$3((11+5)/2) = 24$$
.

(c) Using the properties of the integral.

SOLUTION:

$$\int_{2}^{5} (2x+1) dx = \int_{2}^{5} 2x dx + \int_{2}^{5} 1 dx$$

$$= 2 \int_{2}^{5} x dx + (5-2)(1)$$

$$= 2 \left(\int_{0}^{5} x dx + \int_{2}^{0} x dx \right) + 3$$

$$= 2 \left(\frac{1}{2} 5^{2} - \int_{0}^{2} x dx \right) + 3$$

$$= 2 \left(\frac{25}{2} - \frac{1}{2} 2^{2} \right) + 3$$

$$= 2 \left(\frac{21}{2} \right) + 3 = 21 + 3 = 24$$

- (4) Use the basic properties of the integral to calculate the following.
 - $(a) \int_1^4 6x^2 \, dx$

SOLUTION:

$$\int_{1}^{4} 6x^{2} dx = 6 \int_{0}^{4} x^{2} dx - 6 \int_{0}^{1} x^{2} dx = 6 \left(\frac{1}{3} (4)^{3} - \frac{1}{3} (1)^{3} \right) = 126.$$

(b)
$$\int_{-2}^{3} (3x+4) dx$$

SOLUTION:

$$\int_{-2}^{3} (3x+4)dx = 3 \int_{-2}^{3} x \, dx + 4 \int_{-2}^{3} dx$$

$$= 3 \left(\int_{-2}^{0} x \, dx + \int_{0}^{3} x \, dx \right) + 4(3 - (-2))$$

$$= 3 \left(\int_{0}^{3} x \, dx - \int_{0}^{-2} x \, dx \right) + 20$$

$$= 3 \left(\frac{1}{2} 3^{2} - \frac{1}{2} (-2)^{2} \right) + 20 = \frac{55}{2}$$

(c)
$$\int_{1}^{3} |2x - 4| dx$$

SOLUTION: The area between |2x - 4| and the x axis consists of two triangles above the x-axis, each with width 1 and height 2, and hence with area 1. The total area, and hence the definite integral, is 2.

(5) Evaluate
$$\lim_{N\to\infty}\frac{1}{N}\sum_{j=1}^N\sqrt{1-\left(\frac{j}{N}\right)^2}$$
 by interpreting the limit as an area.

SOLUTION: The limit represents the area between the graph of $y=f(x)=\sqrt{1-x^2}$ and the x-axis over the interval [0,1]. This is the portion of the circular disk $x^2+y^2\leq 1$ that lies in the first quadrant. Accordingly, its area is $\frac{1}{4}\pi(1)^2=\frac{\pi}{4}$.
